
Name: Rajput Yash Mahendra

PRN: 202501070113

Batch: ET-1 (E15)

Topic :- Paper Review

1.Total number of papers

Problem: Find the total number of research papers submitted.

Solution:

```
total_papers = df.shape[0]  
print(total_papers)
```

2. Total Authors Participated

Problem: Find the number of unique authors

Solution:

```
authors = df['authors'].str.split(',').explode().unique()
print(len(authors))
```

3. Most Published Author

Problem: Identify the author with the highest number of papers.

Solution:

```
author_count =
df['authors'].str.split(',').explode().value_counts()
print(author_count.idxmax(), author_count.max())
```

4. Acceptance Analysis

Problem: Does higher reviewer score lead to acceptance?

Solution:

```
accepted = df[df['decision'] == 'Accepted']
print(accepted['reviewer_score'].mean())
```

5. Most Reviewed Paper Topic / Journal

Problem: Find the journal with the highest submissions.

Solution:

```
journal = df['journal'].value_counts()
print(journal.idxmax(), journal.max())
```

6. Papers Accepted vs Rejected

Problem: Compare number of accepted and rejected papers.

Solution:

```
print(df['decision'].value_counts())
```

7. Average Citations per Paper

Problem: Calculate average citations.

Solution:

```
import numpy as np
avg_citations = np.mean(df['citations'])
print(avg_citations)
```

8. Highest Cited Paper

Problem: Find paper with highest reviewer rating.

Solution:

```
import numpy as np
avg_citations = np.mean(df['citations'])
print(avg_citations)
```

9. Lowest Reviewer Score Paper

Problem: Identify weakest paper based on review.

Solution:

```
low_score = df.loc[df['reviewer_score'].idxmin()]
print(low_score)
```

10. Most Active Journal/Conference

Problem: Find journal with most publications.

Solution:

```
journal = df['journal'].value_counts()  
print(journal.idxmax())
```

11. Year with Maximum Publications

Problem: Identify year with highest research activity.

Solution:

```
year = df['year'].value_counts()  
print(year.idxmax())
```

12. Top 4 Journals

Problem: Find top 4 journals by number of papers.

Solution:

```
top4 = df['journal'].value_counts().head(4)  
print(top4)
```

13. Acceptance Rate per Year

Problem: Analyze acceptance trend over years.

Solution:

```
yearly_accept = df.groupby('year')['decision'].apply(lambda x:  
(x=='Accepted').mean()*100)  
print(yearly_accept)
```

14. Papers per Journal

Problem: Count number of papers per journal.

Solution:

```
papers_journal =  
df.groupby('journal').size()  
print(papers_journal)
```

15. Reviewer Score Distribution

Problem: Analyze reviewer scoring trend.

Solution:

```
score_dist = df['reviewer_score'].value_counts()  
print(score_dist)
```

16. High Quality Papers (

Problem: Identify highly rated papers.

Solution:

```
high_quality = df[df['reviewer_score'] > 8]  
print(high_quality)
```

17. Correlation between Citations and Score

Problem: Check relationship between citations and reviewer score.

Solution:

```
corr =  
df[['citations', 'reviewer_score']].corr()  
print(corr)
```

18. Journal with Most Rejections

Problem: Identify journal with highest rejected papers.

Solution:

```
rejections = df[df['decision']=='Rejected']['journal'].value_counts()  
print(rejections.idxmax())
```

19. Standard Deviation of Citations

Problem: Measure variation in citations.

Solution:

```
std = np.std(df['citations'])  
print(std)
```

20. Papers per Author

Problem: Count number of papers written by each author.

Solution:

```
author_papers = authors.value_counts()  
print(author_papers)
```
